Website & Domain Audit

Athlon Jiu Jitsu

athlonjiujitsu.com · September 12, 2026

Prepared by VIIS, LLC (d/b/a VIIS Partners)

01 Summary

We checked `athlonjiujitsu.com` from the outside on September 12, 2026, using nothing but the domain name and the email address submitted with the request. Fifteen checks produced three findings, one medium and two low, alongside twelve that passed. The three that matter most: your site takes 3.1 seconds to become usable on a phone, your server reports success for addresses that do not exist, and your site omits several standard browser protections.

Critical	0
High	0
Medium	1
Low	2
Passed	12
Not assessed	0

MEDIUM

Your site takes 3.1 seconds to become usable on a phone

What we found. The largest piece of content on your homepage finished loading after 3.1 seconds on mobile, measured in a simulated test, because your site does not receive enough traffic for Google to have collected real visitor measurements. Google treats anything above 2.5 seconds as poor.

What it costs you. Most visitors arriving from a phone leave before the page finishes rendering. Site speed and conversion are consistently correlated in published research, though the size of the effect varies by industry and market.

LOW

Your server reports success for addresses that do not exist

What we found. A request for <https://athlonjiujitsu.com/viis-audit-missing-page-check>, which is not a real page, was answered with a success status rather than a not-found response. The page shown to a visitor may well say it could not be found; the status code sent with it does not.

What it costs you. Search engines and link checkers read the status code rather than the message on the page. Addresses that were never real can be indexed, and a mistyped or outdated link looks like it is working to anything checking automatically — including us.

LOW

Your site omits several standard browser protections

What we found. Your pages are served without Content-Security-Policy.

What it costs you. These headers are how a site tells a browser what to refuse: which other sites may embed your pages, and what may load inside them. Without them the browser applies no restriction.

03 Findings by category

SITE

MEDIUM

Your site takes 3.1 seconds to become usable on a phone

What we found. The largest piece of content on your homepage finished loading after 3.1 seconds on mobile, measured in a simulated test, because your site does not receive enough traffic for Google to have collected real visitor measurements. Google treats anything above 2.5 seconds as poor.

What it costs you. Most visitors arriving from a phone leave before the page finishes rendering. Site speed and conversion are consistently correlated in published research, though the size of the effect varies by industry and market.

LOW

Your server reports success for addresses that do not exist

What we found. A request for <https://athlonjiujitsu.com/viis-audit-missing-page-check>, which is not a real page, was answered with a success status rather than a not-found response. The page shown to a visitor may well say it could not be found; the status code sent with it does not.

What it costs you. Search engines and link checkers read the status code rather than the message on the page. Addresses that were never real can be indexed, and a mistyped or outdated link looks like it is working to anything checking automatically — including us.

PASSED

Mobile rendering. At 360px wide, all 8 pages we measured fit the screen without sideways scrolling, declare a viewport that allows zooming, and render their text at a readable size.

PASSED

Accessibility. Automated testing across 8 pages at 360px found no WCAG 2.2 AA violations it can detect, passing 177 rule checks.

PASSED

Broken links. We followed 8 links within your site and 4 to other sites, and all of them resolved without an error or a long redirect chain.

PASSED

TLS / certificate. The certificate for athlonjiujitsu.com was issued by Google Trust Services, validates correctly, and runs for another 50 days. Connections negotiate TLSv1.3, and obsolete versions are refused. Browsers are instructed to stay on the encrypted version of the site.

FOUNDATION

PASSED	DNS. Your DNS is operated by Cloudflare across 2 nameservers, and athlonjiujitsu.com resolves to 104.21.82.89 and 172.67.155.114. Mail for athlonjiujitsu.com is handled by Google Workspace.
PASSED	Email authentication. athlonjiujitsu.com publishes an SPF record ending in ~all, evaluating 1 of the 10 permitted DNS lookups. Its DMARC policy is p=quarantine, with reporting configured. Outgoing mail is signed, on the google selector. Mail is handled by Google Workspace.
PASSED	Domain ownership posture. athlonjiujitsu.com is registered through GoDaddy.com, LLC and has been held since March 19, 2025. The registration runs to March 19, 2028, 554 days from now. It carries a transfer lock. DNSSEC is not enabled.

SEARCH

PASSED	Metadata. Every one of the 8 pages as a browser renders them publishes its own title, description and main heading, and no two pages share a title.
PASSED	Structured data. Across 8 pages as a browser renders them, your structured data declares LocalBusiness, SportsActivityLocation, PostalAddress, and GeoCoordinates and is valid.
PASSED	Analytics and conversion tag presence. Across the 8 pages as a browser renders them, we found Google Analytics 4 and Cloudflare Web Analytics.
PASSED	Google Business Profile — public view. A verified Google Business Profile is published for the business under the category Jujitsu school. It carries 35 reviews averaging 5.0.

RISK

LOW

Your site omits several standard browser protections

What we found. Your pages are served without Content-Security-Policy.

What it costs you. These headers are how a site tells a browser what to refuse: which other sites may embed your pages, and what may load inside them. Without them the browser applies no restriction.

PASSED	Vendor lock-in and control. Your website rests on 4 separately operated layers, run between 3 companies: your domain is registered through GoDaddy.com, LLC, DNS is operated by Cloudflare, the site is served by Cloudflare, and mail is handled by Google Workspace.
--------	---

04 What we could not assess from outside

Everything above was determined from a domain name and an email address. The items below cannot be. Each one needs something only you can give: read access to a system you own, or your own sign-in to an account while we are on a call. None of them is visible to anyone outside your business, which is why they are worth asking next.

Whether your domain is set to renew automatically. Not published in registry records. Registries disclose an auto-renew status only after a domain has already lapsed, so its absence beforehand tells us nothing either way. It is in front of you the moment you open the registrar.

FOUNDATION

Requires you to sign in to each account yourself, on a call

Who the domain is registered to. The registry withholds the registrant, as it does for most domains. We can confirm the registration exists and when it runs to, but not whose name is on it. Whose name is on it decides whether you can move the domain without anyone else's cooperation.

FOUNDATION

Requires you to sign in to each account yourself, on a call

How your Microsoft 365 or Google Workspace tenant is configured. Tenant settings are visible only from inside the tenant.

FOUNDATION

Requires Tenant admin read

Whether you are paying for licenses and seats nobody uses. Billing and directory records are not published.

FOUNDATION

Requires Billing and directory read

Whether your tracking records a lead when someone calls or submits a form. We can see that tracking code is present. Whether it fires and what it records are not observable from outside. A tag manager holding no configured tags looks exactly like a fully configured one from here.

SEARCH

Requires Analytics property and tag manager access

Where you rank across your service area, block by block. Rank varies by the searcher's location and is not observable from a single vantage point.

SEARCH

Requires Third-party rank tooling, priced per location

What people actually search before they reach you, and what they do next. Search Console and analytics data belong to your properties and are not public.

SEARCH

Requires Property-level delegated access

Whether the accounts holding your domain, DNS and hosting are yours. We can see which companies operate each layer, but not whose name is on the accounts. Whether you could move any of it without your current provider's cooperation depends on who controls those logins, and that is not visible from outside.

RISK

Requires you to sign in to each account yourself, on a call

Whether your backups exist, cover what matters, and have ever been restored. Backup coverage and restore history are internal records.

RISK

Requires Admin read

Who holds administrator access to your systems. Account roles are not published.

RISK

Requires Directory read

Whether multi-factor authentication is enabled on your accounts. Sign-in policy is visible only from inside the directory.

RISK

Requires Directory read

How many former employees still have working logins. Account status is not published.

RISK

Requires Directory read

We ran fifteen checks against `athlonjiujitsu.com` on September 12, 2026, all of them from outside, using only the domain name and the email address submitted. No credentials were used and no access to your systems was required or requested. Every finding in this report is recorded against the raw output it came from, which we keep.

What these results do not cover.

Automated accessibility testing detects roughly a third of the issues in the WCAG 2.2 AA standard. Keyboard traps, the order focus moves in, whether alt text actually describes an image, and whether a screen reader reads a page coherently all need a person working through the site.

Performance measured in a laboratory is a simulation. Where Google holds enough real visitor data for your site, we report that instead and say so.

Performance was measured twice on mobile and twice on desktop. Each figure reported is the median of those analyses: the largest contentful paint on mobile ranged from 2.9 seconds to 3.4 seconds, the mobile performance score ranged from 87 to 91, and the desktop performance score ranged from 100 to 100.

We detected which tracking tags are present. Whether a tag fires and what it records cannot be observed from outside.

DKIM was probed across the selector names in common use and the ones your mail provider normally uses. A negative result means we did not find one, not that none exists.

This is not a security assessment and not a penetration test. We observed what your systems publish to anyone who asks, and nothing more.

What we could not determine on this run. Deeper access would not settle these. They are not observable from outside, or the check did not complete.

Whether your site is genuinely usable with a keyboard and a screen reader. Automated testing detects roughly a third of WCAG 2.2 AA issues. Keyboard traps, the order focus moves in, whether alt text actually describes the image, and whether a screen reader reads the page coherently all require a person working through the site. A clean automated result is not a statement that the site is accessible.

SITE

Whether any link on your site points to a page that no longer exists. Your server answers with a success status for addresses that do not exist, whatever the page then shows a visitor. A link to a deleted page is therefore indistinguishable from a working one to anything reading status codes. We checked every link and none reported an error, but on this site that result cannot be relied on.

SITE

Whether an administrator login is reachable at a default address. Your server answers with a success status for addresses that do not exist, including <https://athlonjiujitsu.com/viis-audit-missing-page-check>. We cannot tell a real login page from an address that merely answers, so we did not test for one.
